What is Artificial Intelligence (AI) in Business? - IBM

🔍 Informacje o fragmentach z odpowiedzią • 🗨️ Prześlij opinię

AI and ML are often used interchangeably but differ significantly. Many definitions **lack clarity** or **fail to distinguish between tools and goals.**

<https://levity.ai/blog/difference-machine-learning-deep-learning>

What is AI? Clearing the Confusion

Machine Learning (ML):

Focus: Data analysis, pattern recognition, and prediction.

Methods: Algorithms like decision trees, SVMs, neural networks.

Goal: Explore and learn patterns from data.

Example: Predicting house prices or classifying images.

Artificial Intelligence (AI):

Focus: Enabling machines to make informed decisions or recommendations.

Broader scope: Combines ML, reasoning, optimization, and explainability.

Goal: Assist or automate decision-making processes.

Example: Recommending a business location based on multiple data layers.

What is AI? Clearing the Confusion

Machine Learning (ML):

Artificial Intelligence (AI):

**AI is for decision-making;
ML is for analysis and exploration.**

AI leverages ML insights but **goes further** by integrating rules, reasoning, and context to **support actionable decisions.**

**Human
Intelligence**

**General goal of
intelligence:**

**Learn from experience
and draw insights**

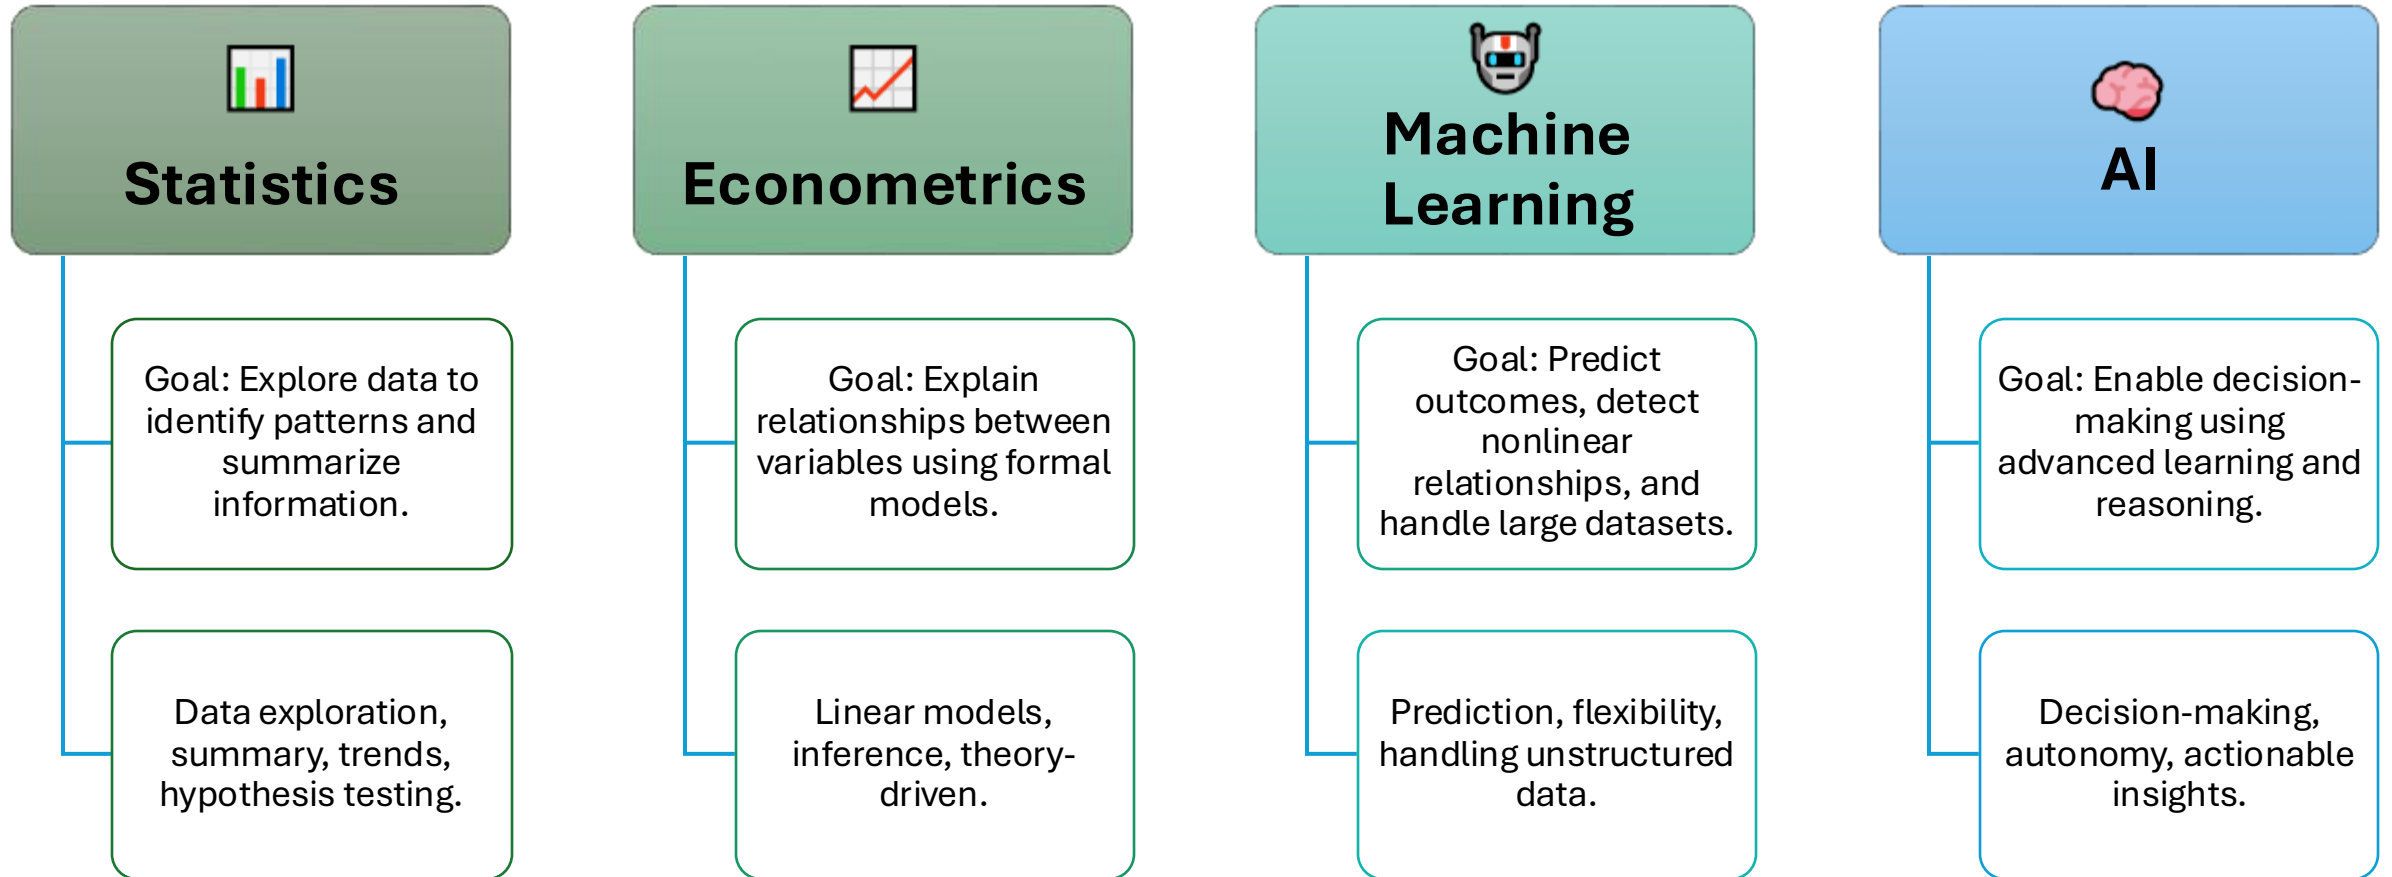

Machine Learning models

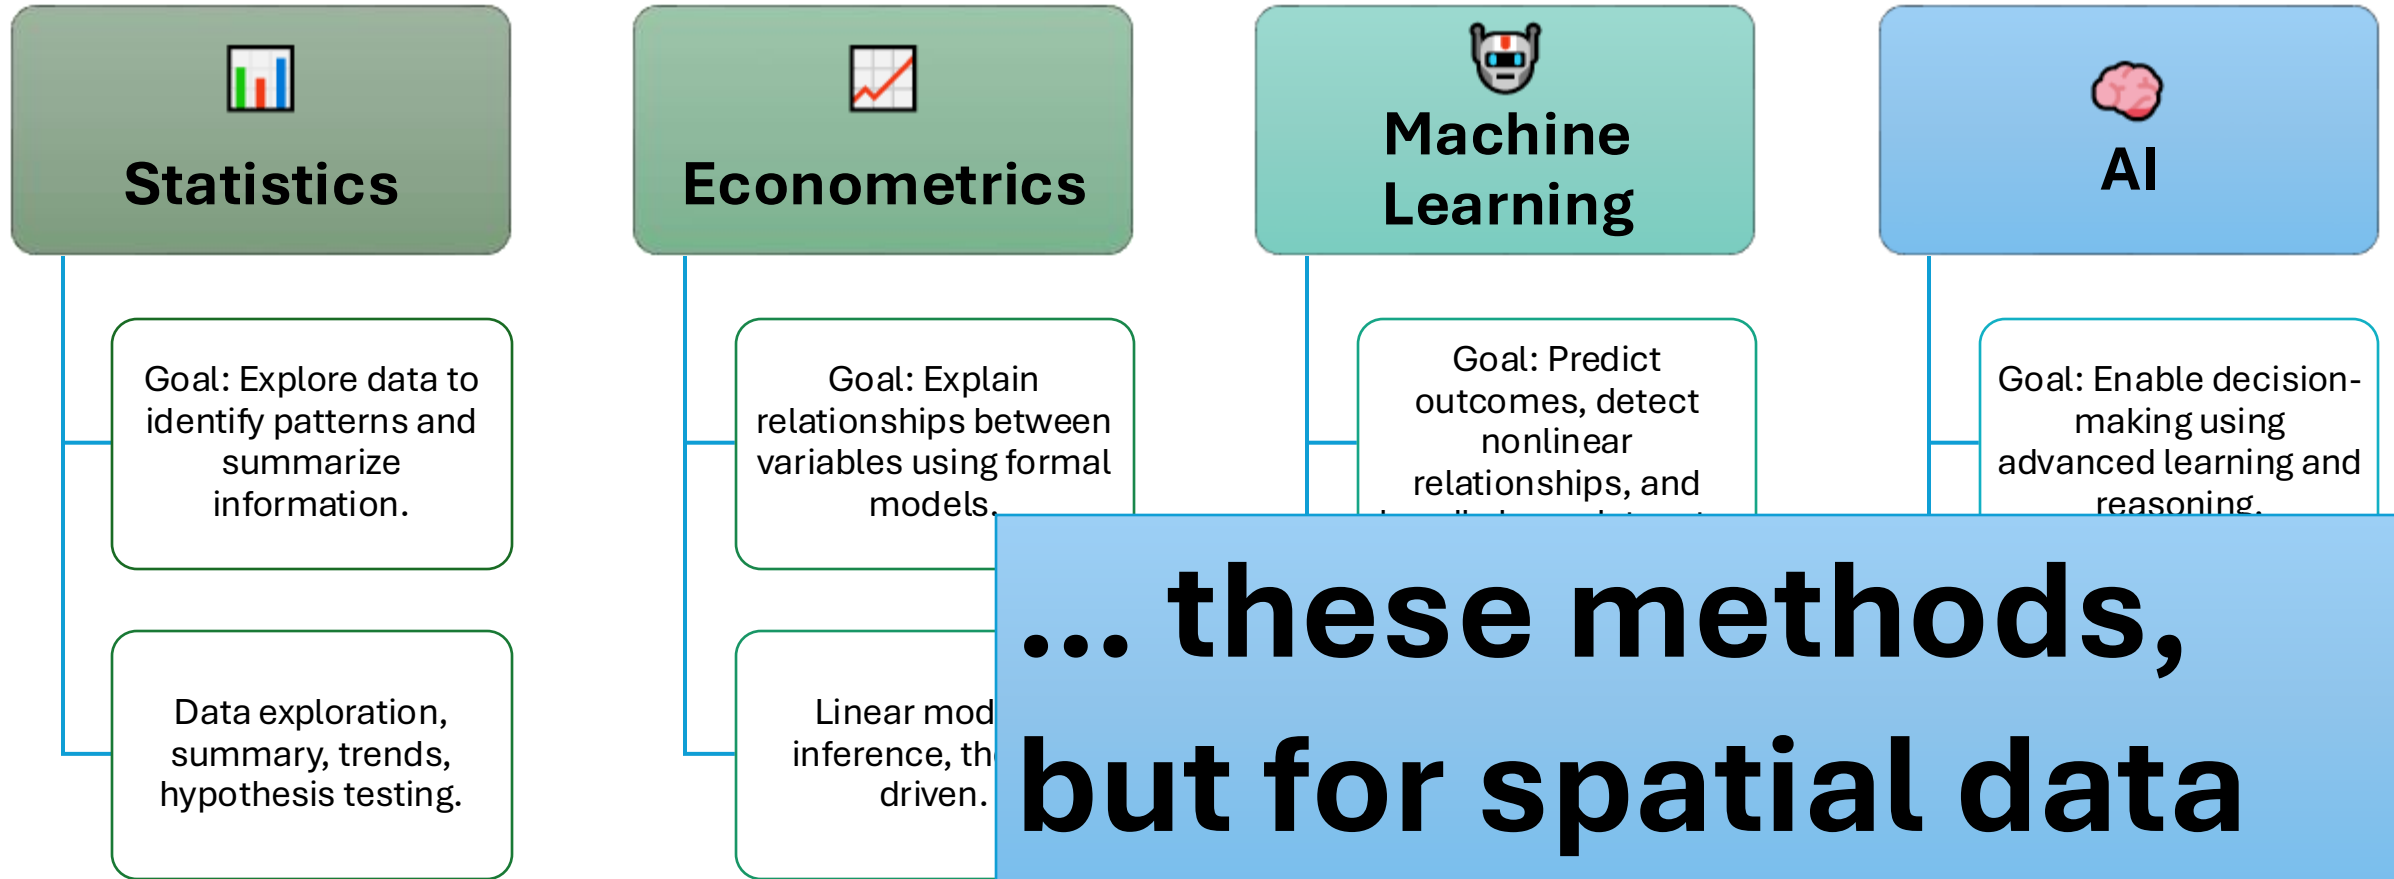

**Artificial
Intelligence**

**To make decisions
and take actions**

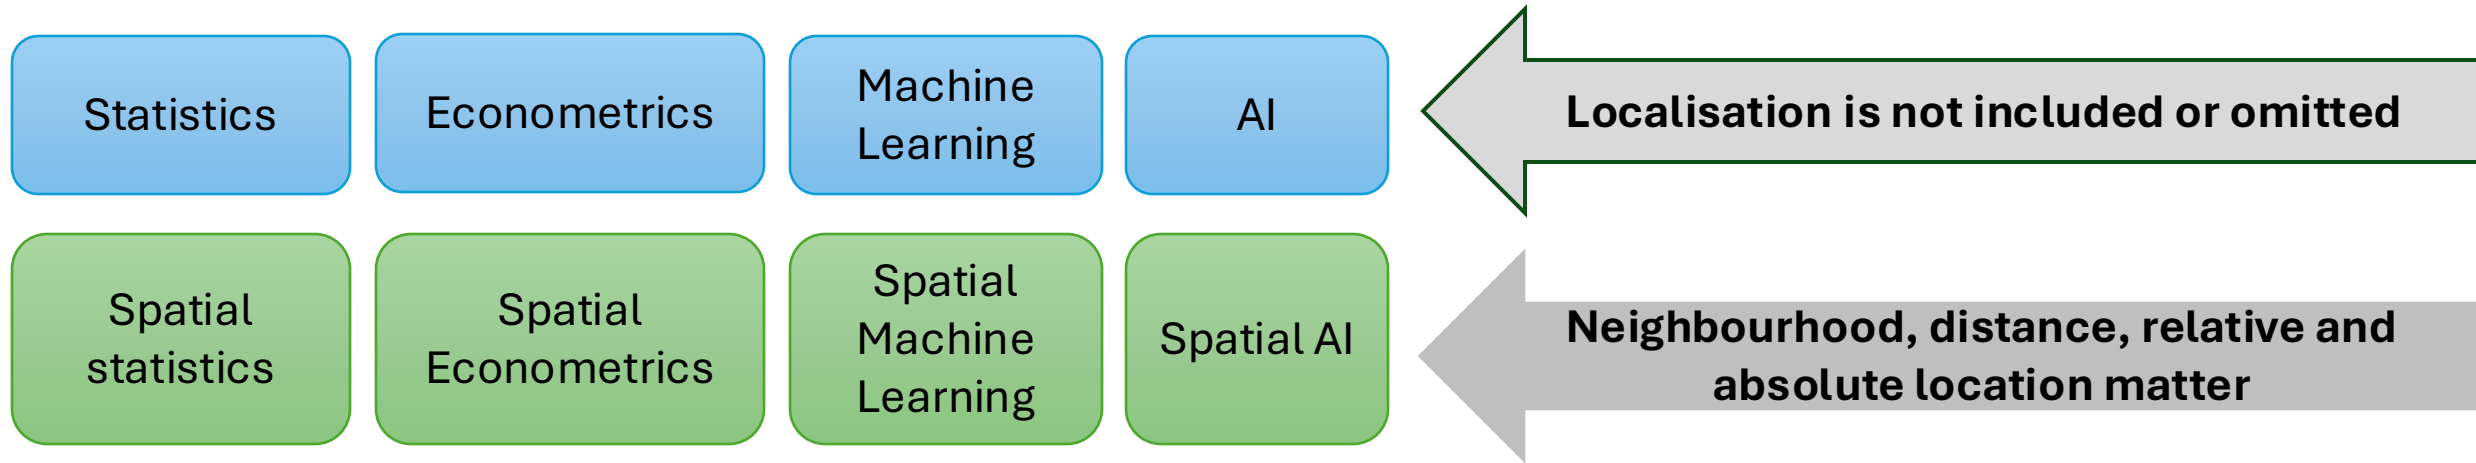

Towards AI: Where Are We Now?

Towards AI: Where Are We Now?

Add spatial component to the analysis

Why Spatial Data is Different:

- **Spatial heterogeneity:** Variations across locations; relationships aren't uniform.
- **Proximity-based relationships:** Observations are often interdependent (spatial autocorrelation).

Importance for Regional Science:

- Decisions are inherently spatial (e.g., business locations, infrastructure planning).
- AI must understand space to provide actionable insights.

Our proposition: **FAIRS**

FAIRS - a novel framework
for AI in regional science
that is:

- Fit-for-purpose,
- Actionable,
- Interpretable,
- Replicable
- Spatially-aware

FAIRS - Framework for AI in Regional Science

Empirical Study: Optimal Business Location

How to use spatial AI for Regional Science –
a practical example

Empirical study

Actionable business insight:
For a specific location – what will
be the best type of business?

Objective:

- Use AI to recommend optimal business locations in Poland.
- Focus: Identify which types of businesses are best suited to specific locations based on spatial and economic data on already existing patterns.

Data Overview:

- **Study area:** Whole population of firms from Mazowieckie, Poland (all companies operating there in 2012 – info from REGON database).
- **Spatial Data:** Proximity to competitors. Distances to different city types (core, midsize, regional, local).
- **Economic Data:** Business sectors (agriculture, service, construction, production). Local business aggregation by sector.
- **Other Variables:** Neighborhood indicators (e.g., population density, firm density). Demographic factors (e.g., local population characteristics).

Study Design:

- Use ML classification models for the analysis.
- Incorporate spatial features into AI-driven recommendations and adjust the modelling procedure for spatial data.
- Steps:
 - **Analysis phase:** Classification of locations based on the already existing information on the types of businesses successfully operating there.
 - **Decision phase:** Use AI outputs for actionable location-based recommendations.

Data Description

Target Variable

class4: Categorical variable representing the business sector:

Agriculture, Service, Construction, Production

Spatial Variables

- lon, lat: Longitude and latitude of the business locations, representing their spatial coordinates.

Distance Metrics:

- Distances to various city types at three thresholds (10 km, 25 km, 50 km):
- Core Cities:** dist_core_10, dist_core_25, dist_core_50
- Midsize Cities:** dist_midsize_10, dist_midsize_25, dist_midsize_50
- Regional Cities:** dist_regional_10, dist_regional_25, dist_regional_50
- Local Big Cities:** dist_localbig_10, dist_localbig_25, dist_localbig_50
- Local Small Cities:** dist_localsmall_10, dist_localsmall_25, dist_localsmall_50

These variables capture **proximity to urban centers** of varying sizes and their influence on location attractiveness.

Core Density Checks:

- COREfirms: Indicates if the location is within a high-density core of firms.
- COREpopul: Indicates if the location is within a high-density population area.

agri	constr	prod	serv
253514	71579	63989	594637
25.77%	7.28%	6.50%	60.45%

Number of observations: 983719

Number of variables: 31

Economic Variables

Local Aggregation of Businesses by Sector:

- locAggAgri.s: Number of businesses in agriculture.
- locAggProd.s: Number of businesses in production.
- locAggConstr.s: Number of businesses in construction.
- locAggServ.s: Number of businesses in services.
- locAggTOTAL.s: Total number of businesses in all sectors.

Local Business Diversity:

- locHH.s (**Herfindahl Index**): A measure of business concentration in the area. Higher values indicate less diversity (more dominance of certain sectors).

Local Industry Specialization:

- locLQ.s (**Location Quotient**): Indicates the degree of specialization in a specific industry relative to a broader reference region.

Demographic Variables

Local Population Density:

- locPdens.s: Population density in the immediate vicinity.

Numeric variables are standardised to 0-1 range

Considered models: XGBoost, Random Forest, LightGBM, LiblineaR

Handling large and high-dimensional datasets

Multiclass classification:
Native support for predicting multiple business categories.

XGBoost:

- High-performance, scalable predictions with robust regularization.
- Exceptional accuracy and efficiency for large, complex datasets.

Random Forest:

- Reliable ensemble predictions by combining multiple decision trees.
- Robustness to overfitting and ability to handle high-dimensional data.

LightGBM:

- Fast training with efficient memory usage for large-scale data.
- Optimized for speed and scalability in multiclass classification.

LiblineaR:

- Efficient linear classification for high-dimensional sparse data.
- Simplicity and speed for quick evaluation of linear relationships.

Linear (LiblineaR) and Nonlinear (XGBoost, Random Forest, LightGBM).

Spatial CV tests the models across diverse spatial areas, checking their stability in different environments. At the same time, it avoids the data leakage issue

Final evaluation of the XGBoost model

Overall Statistics

Accuracy : 0.9296
95% CI : (0.9291, 0.9301)
No Information Rate : 0.6045
P-Value [Acc > NIR] : < 2.2e-16

Kappa : 0.8683

Mcnemar's Test P-Value : < 2.2e-16

Statistics by Class:

	Class: agri	Class: constr	Class: prod	Class: serv
Sensitivity	0.9884	0.56938	0.61432	0.9818
Specificity	0.9904	0.99458	0.99644	0.8612
Pos Pred Value	0.9728	0.89182	0.92303	0.9153
Neg Pred Value	0.9960	0.96714	0.97378	0.9687
Prevalence	0.2577	0.07276	0.06505	0.6045
Detection Rate	0.2547	0.04143	0.03996	0.5935
Detection Prevalence	0.2619	0.04646	0.04329	0.6484
Balanced Accuracy	0.9894	0.78198	0.80538	0.9215

Confusion Matrix and Statistics

	Reference			
Prediction	agri	constr	prod	serv
agri	250579	883	994	5139
constr	17	40756	2006	2921
prod	2	521	39310	2755
serv	2916	29419	21679	583822

Quite good and stable prediction, general accuracy at the level of 0.9296. Still, possible room for improvement for better handling of categories “construction” and “production” – they are frequently misclassified as service.

Key Takeaways

AI in Regional Science: A Decision-Making Tool

- Artificial Intelligence (AI) goes beyond pure Machine Learning (ML) by transforming data insights into actionable decisions.
- AI supports **decision-making** through integration of predictions, reasoning, and domain-specific considerations, bridging research and practical applications.

The Importance of Spatial Context

- Regional science requires methods that account for the unique characteristics of **spatial data**, such as heterogeneity and proximity-based relationships.
- **Spatial Machine Learning** must address these challenges, ensuring robust evaluation frameworks like spatial cross-validation and avoiding data leakage.
- AI in regional science must inherently incorporate spatial understanding, enriching insights and making location-sensitive decisions.

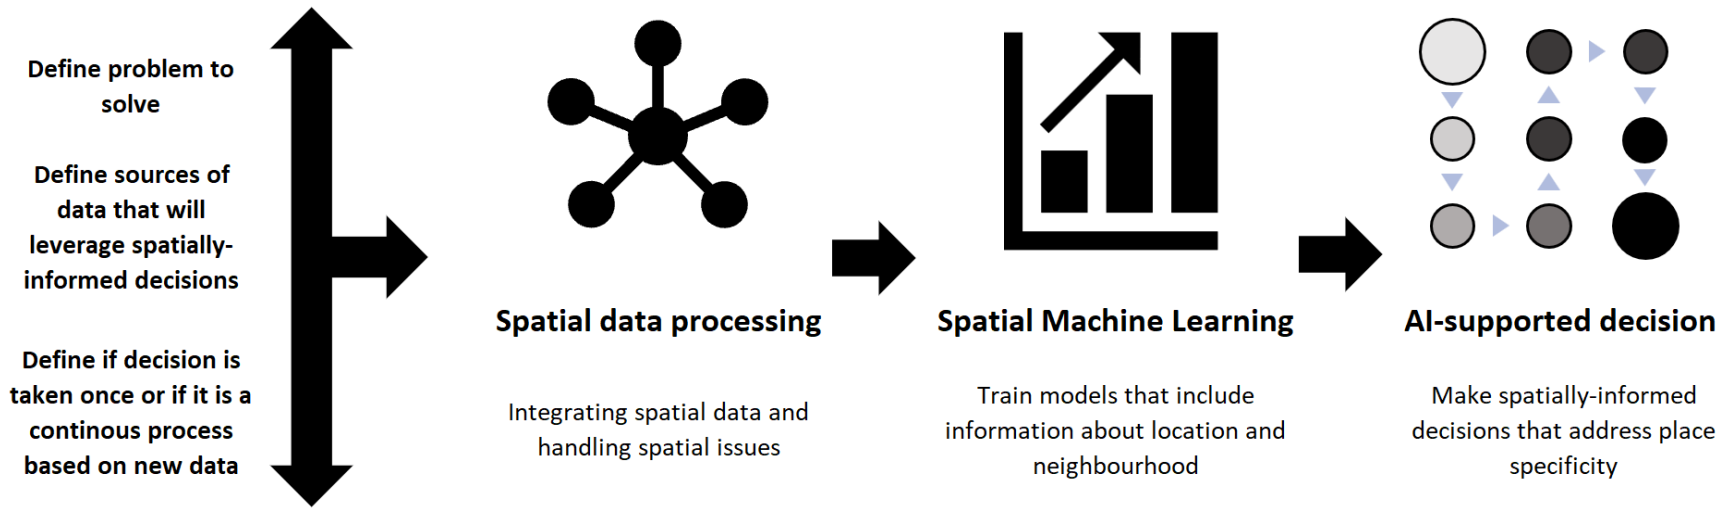

From Research to Real-World Applications

- Our example demonstrated how **spatial ML** can be applied to predict optimal business locations.
- The resulting AI-driven decision-making tool highlights how these methods can guide **business actors** in choosing locations or **policy makers** in supporting regional economic development.

Broader Implications

- The integration of spatially-informed AI opens new possibilities for answering regional science questions, combining methodological advancements and merging of ML with spatial econometrics insights with real-world utility.
- Such tools can be adapted beyond research to tackle practical challenges in urban planning, economic development, and resource allocation.
